Do you have a diagnosis of Complex Regional Pain Syndrome (CRPS) of the Lower Extremity?

You might be eligible for a research study that aims to compare the pain relief patients can obtain from two devices used to treat Complex Regional Pain Syndrome I or II. This study compares patient outcomes following a treatment that delivers small pulses of electric onto pain transmitting nerves using Dorsal Column Spinal Cord Stimulation and Dorsal Root Ganglion Stimulation.

**Key Inclusion Criteria:**

Patients with aggravating pain who have failed 4 weeks of conservative management for their CRPS displaying sensory, motor and/or sudomotor symptoms.

*Patients should not have an implantable device.

*Compensation will be provided for your time.*

*The study is conducted in the Pain Management Department located at the Cleveland Clinic in Ohio.*
